# FITMENT AND SAFETY

- Test fitment before fitting the tyre. Test PCD, Centre Bore, Offset and X-Factor clearance.
- Make sure correct nuts/bolts are being used.
- Check wheel load capacities.
- Check if a Centre Ring is needed.
- Once fitted Spin wheel & tyre combination before lowering vehicle.
- Torque wheel bolts/nuts to manufacturer specification in correct sequence.
- Check nuts/bolts for spare wheel
- Check wheel spanner fitment
- Re-torque wheel bolts/nuts after 100km - 500km

## WHEEL CARE

**It is important to keep your wheels clean at all times. Protect your investment.**

Some alloys have a transparent top coating designed to provide both protection and an ideal finishing gloss. This transparent protective coating must be maintained with the same care given to your car's paint finish.

We suggest cleaning the wheels frequently to keep dirt and brake dust from altering the gloss finish. Remember, they're often the dirtiest part of your vehicle because they are constantly exposed to the elements (corrosive brake dust, ocean salt, paint-chipping stones and sticky tar).

Your brakes will cause the wheels to heat up, this heat in turn can cause any dirt or brake dust to bake into the clear coat, thus cleaning regularly is essential.The best wheel cleaning solution is mild soap and water (Avoid alcohol based products, solvents, petrol etc.).

Remember to hose all the loose abrasive grit off first. Clean with a soft un-abrasive cloth. Aluminum wheel polish can be used on polished wheels.

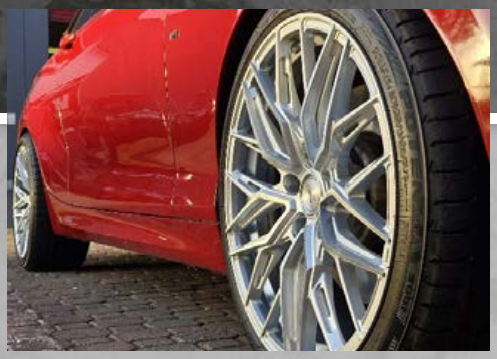

Do not use steam cleaners in automatic car washers. Hot steam can dull the paint and clear coat finish on your wheels. Even cause the clear coat to start peeling.

Do not use tyre cleaners on Alloy wheels. Clean wheels when cool and one wheel at a time. This prevents the soap from drying and becoming difficult to rinse off.

Water dries much faster at higher temperatures. Thus, cleaning wheels while they are hot may cause your mild soap solution to dry too quickly leaving spots or a film of soap on your wheels.

Every type of interference with the rim material (heating, welding, adding of materials, or even engraving, etching and grinding, general repairs) results in a change in material properties and invalidates the strength test report.

The wheel owner thus loses all rights to liability and warranty claims. The Wheels must never be modified or altered in any manner from their original conditions of delivery.
